A (BUJA/) BUJAKD H. X T Bujard H, Pan W, Tolle R; WPI; 1998-240088/21. N-PSDB; AAV21451, AAV35363. Recombinant production of complete gp190/MSP-1 Plasmodium surface protein - useful in anti-malaria vaccines, also stabilising genes by reducing their AT content

Example 1; Fig 3c; 48pp; German.

This sequence represents a modified Plasmodium falciparum gpl90/MSP-1 (merozoite surface) protein. The gene encoding this protein has been stabilised by reducing the AT content of the nucleotide sequence. Such a protein is useful in vaccines against malaria or for producing monoclonal antibodies (for passive immunisation). The complete gpl90 protein can now be produced outside the parasite and has, at least over extended regions, the native pattern of folding. Larger amounts of the protein can be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The nucleic acid sequence encoding MSP-1-42 has been modified (see AAX25586) compared to the native sequence (see AAX25587) such that 306 nucleotide positions have been replaced to lower the AT content (from 76 to 49.7%) and to eliminate 10 mRNA instability motifs while maintaining the same protein amino acid sequence. These alterations allow MSP-1-42 to be expressed in mammalian cell culture and in transgenic mice. The invention provides modified recombinant nucleic acid sequences and methods for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New modified recombinant nucleic acid sequences useful for producing malarial DNA vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          provides mountain the containing that are defined and increasing the mRNA levels and protein expression of proteins that are difficult to express in cell culture systems, mammalian cell culture systems or in transgenic animals. The preferred difficult protein candidates for expression are those derived from lower corganisms such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used. The invention allows expression of MSP-1 protein in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 AVTPSVIDNILSKIENEYEVLYLKPLAGVYRSLKKQLENNVATFNVNVKDILNSRFNKRE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against target for the development of a vaccine against the plant and interpret of a vaccine sequence encoding MSP-1-42 has been modified (see AAX56008) compared to the native sequence (see AAX56009) such that 306 nucleotide positions have been replaced to lower the AT content (from 76 to 49.7%) and to eliminate 10 mRNA instability motifs while maintaining the same protein amino acid sequence. These alterations allow MSP-1-42 to be expressed in sequence. These alterations allow MSP-1-42 to be expressed in sequence. Instability motifically to express in cell culture systems. The invention allows expression of MSP-1 protein in the milk of invention allows expression of MSP-1 protein in the milk of transgenic animals. and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GYYKILSEKYKSDLDSIKKYINDKQGENEKYLPFLNNIETLYKTVNDKIDLFVIHLEAKV 1443

This present sequence comprises a 42 kDa C-terminal portion of malaria merczoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against Plasmodium falciparum. The C-terminal end of the sequence is modified to include a 6xHis tag. Nucleic acids (see AAX25586 and AAX25593) encoding MSP-1-42 have been modified according to a method of the invention in order to improve expression in mammalian cells and in transgenic animals. The invention provides modified recombinant nucleic acid sequences and methods for increasing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New modified recombinant nucleic acid sequences useful for producing

Plasmodium falciparum. The C-terminal end of the sequence is modified to include a 6xHis tag. A nucleic acid (see AAX56008) encoding MSP-1-42 has been modified according to a method of the invention in order to improve expression in mammalian cells and in transgenic animals by reducing the AT content and removing mRNA instability motifs. The invention allows expression of MSP-1-42 in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 nucleic

                                                                                                                                                                   Gaps
         to express in cell culture systems, especially mammalian cell culture systems or in transgenic animals. The preferred difficult protein candidates for expression are those derived from lower corganisms such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used. The invention allows expression of MSP-1 in the milk vector containing the altered MSP-1-42 nucleic acid.
mRNA levels and protein expression of proteins that are difficult

                                                                                                                                                                                                                                                                                                                   The present sequence represents a 42 kDa C-terminal portion of manalaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The sequence has been modified to include an N-terminal beta-casein signal peptide and an N-terminal faxHistary. In addition, NIBIQ and N262Q mutations have been introduced eliminate 2 N-01ycosylation sites. These modifications allow the MSP-1-42 protein to be expressed in the milk of transgenic mice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             256 VFENLAKTVLSNLLDGNLQGMLQISQHQCVKKQCPQNSGCFRHLDEREECKCLLNYKQEG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;
                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The sequence has been modified to include plasmodium falciparum. The sequence has been modified to include on N-terminal beta-casein signal peptide and an N-terminal 6xHis tag. In addition, N1810 and N2620 mutations have been introduced to eliminate 2 N-glycosylation sites. These modifications allow the MSP-1-42 protein to be expressed in the milk of transgenic mice. The invention generally relates to modified recombinant nucleic acid sequences and methods for increasing the mRNA levels and coll culture systems, mammalian cell culture systems or in cell culture systems. The preferred difficult protein candidates for transgenic animals. The preferred difficult protein candidates for transgenic animals. The preferred difficult protein candidates for expression are those derived from lower organisms such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used.

The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least MSP-1_4_2, compared to natural MSP-1_1_9. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is MSP-133 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1443

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                            Major merozoite surface protein-1; MSP1-42; melittin signal peptide; malaria vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a major merozoite surface protein-1 C-terminal fragment of 42kDa (MSP1-42). This fragment is linked to amelittin signal peptide, and then expressed in a in a silkworm/baculovirus system. The protein is used to prepare a malaria vaccine, which is used to treat or prevent malaria, caused hany of the four species of Plasmodium that infect humans.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The polypeptide contains at least one epitope of the 190 kD precursor of the major merozoite surface antigen of P.falciparum. The polypeptide is immunogenic and can be used in vaccines to protect against malaria. Presence of the affinity peptide allows the polypeptide to be purified by affinity chromatography resins. Antibodies raised against the polypeptide are useful for diagnosis and for purificn. by affinity

The polypeptide contains at least one epitope of the 190 kD precursor of the major merozoite surface antigen of P.falciparum. The polypeptide is immunogenic and can be used in vaccines to protect against malaria. Presence of the affinity peptide allows the polypeptide to be purified by affinity chromatography resins. Antibodies raised against the polypeptide are useful for diagnosis and for purificn. by affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polypeptides - derived from Plasmodium falciparum 190 kD precursor useful in vaccines, and encoding DNA sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence encodes a polypeptide which contains the unique sequence of the surface antigen of P. falciparum, but lacks the immunodomlnant repeat sequences which may allow the parasite to evade and decoy the immune system. The DNA for the stage-specific late schizoint-merozoite antigen 31-1 in p31-1 (W08503725) was modified to delete the entire sequence coding for the repitope. The expression plasmid, 31-1 Repeated Delete, was introduced into E.coli K12 to produce the modified peptide. The transformant has been deposited in the Deutsche Sammlung von Microorganismen as been deposited in the Deutsche Sammlung von Microorganismen as E.coli K12 (95636cl) (p31-1 Repeat Delete). The peptide was used in compens. to treat and prevent protozoan parasitic infections.

polypeptides - derived from Plasmodium falciparum 190 kD precursor, useful in vaccines, and encoding DNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The polypeptide contains at least one epitope of the 190 kD precursor of the major merozoite surface antigen of P.falciparum. The polypeptide is immunogenic and can be used in vaccines to profect against malaria. Presence of the affinity peptide allows the polypeptide to be purified by affinity chromatography resins. Antibodies raised against the polypeptide are useful for diagnosis and for purificn. by affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1069 AEIAETENTLENTKILLKHYKGLVKYYNGESSPLKTLSEESIQTEDNYASLENFKVLSKL 1128

                                                                                                                                                                                                                                                                                                                                                                                                             This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum merozoite surface protein 1 (MSP1) 19 kD C-terminal fragment (p19), linked to a glycosylphosphatidylinositol membrane anchoring sequence. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum merozoite surface protein 1 (MSP1) 19 KD C-terminal fragment (p19), linked to a glycosylphosphatidylinositol membrane anchoring sequence. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1..95

                                                                                                                                                                                          invention relates to a malaria vaccine comprising an expression vector, preferably a defective Venezuela equine encephalitis (DVEE) viral vector system, which expresses pl15MSP-1 or its immunogenic fragment after administration to a patient. The pl15MSP-1 protein or fragment raises a humoral and/or cell-mediated response to the erythrocytic merozoite malaria antigen, protecting the patient from a subsequent malaria infection. The DVEE viral vector system continues to express antigen in the patient for a period of days, amonths or even years. The pl15MSP-1 antigen may also include a signal peptide and/or an anchor peptide sequence, which enhances the immunogenic response of the patient.

                                                              The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is MSP-119 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1520 NLQGMLNISQHQCVKKQCPQNSGCFRHLDEREECKCLLNYKQEGDKCVENPNPTCNENNG 1579
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Plasmodium falciparum; chromosome 2; human malaria parasite; vaccine; antimalarial; malaria; protozoacide; infection; insecticide.

consideration are useful for the development of vaccines against P. falciparum infection comprising (I) or (II).

Consideration (II) are useful for the development of vaccines against antibody raised to immunogens comprising the vaccines against antibody raised to immunogens comprising the sequences of (I), are antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of fargs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum Sequencing of the Plasmodium chromosome 2 and the campeaut identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasite infectode, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18152 represent nucleotide and protein sequences given in the present inventor, but which are not specifically mentioned within the specification.

p19

```
This is the amino acid sequence of a chimeric protein comprising amino acids 1-32 of the plasmodium vivax merozoite surface protein 1 (MSP1) linked to amino acids Asn1613-Ser1705 which correspond to the 19 KD C-terminal fragment (pl9) of MSP-1 from Plasmodium falciparum. ppl is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1526 NISQHQCVKKQCPQNSGCFRHLDEREECKCLLNYKQEGDKCVENPNPTCNENNGGCDADA 1585

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                 fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, compared to natural MSP-1_4_9. The present sequence is the wild type MSP-1 protein. This sequence was used to generate the variants of the present invention. The non-natural variants of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is the amino acid sequence of a chimeric protein comprising amino acids 1-32 of the plasmodium vivax merozoite surface protein 1 (MSP1) linked to amino acids Asn1613-Ser1705 which correspond to the 19 kD c-terminal fragment (P19) of MSP-1 from Plasmodium falciparum. P19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.

```
AAV24575 and AAV24576 represent the merozoite apical end proteins (MAEP) isolated from two different Plasmodium vivax strains. These proteins are the antigens of the invention, and immunoreact with antibodies against a native MAEP sequence. P. vivax is one of the four malarial species that infects humans, and is difficult to target for a vaccine, as it cannot be cultured in vitro. The preinvasion orientation of malarial merozoites indicates that the apical end plays an important role in the invasion process. The MAEP protein binds to the surface of susceptible crythrocytes from P. vivax susceptible humans and primates, and also binds to rabbit erythrocytes. The antigen can be used for the production of antimalarial vaccines. The antigen can be used for the production of antimalarial particularly P. vivax) blood stage parasites. Synthetic process, and are immunochemically reactive with antibodies raised antigens can be used similarly. As the antigens specifically bind to a cusceptible mammallan red blood cells), and are necessary in the process of invasion of red blood cells), and are necessary in the process of invasion of red blood cells), and are necessary in the process of invasion of red blood cells by a malarial organism. The antigens can ammalian blood cells by malarial organism in susceptible red containing the propagation of a malarial organism in susceptible red
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          71;

g g q Op 셤 g q q g q οy ò Вb δ g ŏ 셤 ò ò ογ Οý οy δ g ò g δ ŏ ŏ δý can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in subsequent identification of the Plasmodium chromsome 2 and the complexity of the parasite biology, a process hampered by the complexity of the parasite lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70078 and AAB1814 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification. 84; 1172 1086 721-INN----CKDDYNNILKEY 1187 919 835 | | : |:| :| | | : | ---HIKCVSSFNNTSDDISSHSSVNKKEPFFALKNNSIRHIPKENNIIYTSGKSFNHVQD 704 504 661 781 SGGSGNSRRTNPSDNSSDSAKSYADLKHRVRNYLLTIKELKYPQLFDLTNHMLTLCDNI 161 -----NI 604 HGFKYLIDGYEEINELLYKLNFYF---DLLRAKLNDVCANDYCQIPFN----LKIRANE 213 H-YKERKDSFKE-----NFLFFKEKILPSK-KDTCV-----FNEROKDLFEKSNE 647 LDVLKKLVFGYRKPLDNIK--DNVGKMEDYIKKNKKTIENI---NELIEESKKTI----D 264 KNKNATKEEEKKKLYQAQYDLSIYNKQLEEAHNLISVLEKRIDTLKKNENIKELLDKINE 324 IKNPPPANSGNTPNTLLDKNKKIEEHEKEIKEIAKTIKFNIDSLFTDPLELEYYLREKN- 383 807 ----KNIDISAKVETKESTEPN--------EYPN-----GVTYPLSYNDIN 417 SNNIKSMDIFNYVKRKSNLYNNLSSNRDSTVDMHNKYNSEEYINIQRTNKIYELSNKRIR 867 Gaps NALNELNSFGDLINPFDYTKEPSKNIYTDNERKKFINE-IKEKIKIEKKKIESDKKSYE-N--YKLYSMDEIFKVSLKEKKYIDNISNNMERVTYKNEMINEKIS-----KMDDILYPC DRSKSL------NDITK-EYEKLLNEIYDSKFNNNI---------VEKELKYYKNLISKIENE--IET---LVENI------KKDEEQLFEKKITKDENK EMEKVMEKEMEKVMEKEVEKE-LKNEMNNRMNRM---NNEMKNEI---NIYKN----YYLIVLKKEIDKLKVFMPKVESLINEEKKNIKTEGQSDNSEPSTEGEITGQATTKPGQQA GSALEGDSVQAQAQEQKQAQPPVPVPVPEAKAQVPTPPAPVNNKTENVSKLDYLEKLYEF LNTSYICHKYILVSHSTMNEKILKQYKITKEEESKLSSCDPLDLLFNIQNNIPV----DLTNFEKMMGKRYSYKVEKLTHHNTFAS-YENSKHNLEKLTKALKYMEDYSLRNIV----PDEKIL--EVSDIVKVQVQKVLLMNKIDELKKTQLILKNVELKHNIHVPNSYKQENKQEP Length 2485; 543; -----NEIYVDNDKELEIVNEEKKLIYPFNYESDVHKNMNMSIN----Indels DB 21; 579; 5.4%; Score 453.5; DB 2: ilarity 20.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 δy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ANH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis.

(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the used to produce hosts calls which express the polypeptides. (II) wis the production of vectors containing them whitch are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the present invention. AAH55091 to AAH55098 represent invention specifically claims all the polynucleotide sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           84;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3208

                                                                                                                                                                                                                                                                                                                                                                                                                                              open reading frame; ORF; bacterial infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

The invention relates to isolated polynucleotide (I) and probes; polypeptide (II) sequences. (I) is useful as hybridisation probes; colymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags controlly the control of (II) is useful for generating antibodies against it, detecting or controlly an polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical calsorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in casponsible for genetic disorders or other trails to assess biodiversity and to produce other types of data and products dependent on DNA and canno acid sequences. ABG00010-ABG30377 represent novel human of diagnostic mainto acid sequence data for this patient did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -- LCDNIHGFKY 166
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Immunosuppressant and cytostatics activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as lateral and speripheral nervous system diseases, such as lateral alsolations of disease, Huntington's disease, amyotrophic utilisation of the activities such as: Immune system suppression, Activin/Inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer disquosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and constants. 82; Note: The sequence data for this patent did \mathbf{n}^{d} form part of the printed specification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes proteins and their fragments (1) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (1) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against P. falciparum infection. (1) and polyclonal antisera or a monoclonal antised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of the plasmodium chromosome 2 and the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              94;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic. immunosuppressant and cytostatic activity. The polynucleotides are useful im gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous Injuries, peripheral nervous states, peripheral nervous factorial experiences, peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chamcactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and contractions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The sequence data for this patent did not form part of the printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    δ
```

```
The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against p. falciparum infection. (I) and polyclonal antisers or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the

52; parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification. subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many 336 396 588 628 685 625 745 121 KELINNLNDISDELKNCIEQVNSVSRNMANVEKEKENIINELQILRMKNDTMRKRISKFV 180 286 NELDVIKKKLNDEEFLKEEEKKKNIDMVYKIKEYEIQIKEKENEIDSLKKNEQNLHVLKN 510 647 803 861 --KEEMGL 729 862 NLYKLKDNDKIKNLL---EEAKKVSTSVKTLSSSSMQPLSLTPQDKPEVSANDDTSHSTN 918 ELLYKLNFYFDLLRAKLNDVCANDYCQIPFNLKIRANELDVLKKLVFGYRKPLDN----I 231 232 KD-----NVGKMEDYIKKNKKTIENINEL---IEESKKTIDKN---KNATKEEEKKKL 278 -----DILKKNENIKELLDKINEIKNPPPANSGNTPNTLLDKNKKIEEHE 351 KEIKEIAKTIKFNIDSLFTDPLELEYYLREK--NKNIDISÄKVETKES--TEPNEYPNGV 407 457 ----KKKIESDKKSYEDRSKSLNDITKE 487 Gaps ELILKKKNY-EELRLKINHL----ECVERDSVKIN-SEKEKGEKVIYELKEKLDNDEKII -----EEAHNLISVLE------KRI----EQEKVLKFKLYTLNNDIFSKNEKLNDMQKKLNDV-NEKYKNIVECLNNYKTEHK--EQIE 337 NEQLIKDIKDENEKMNEHVNKLONELIKRELONKCISKDIĘFCKKEKEDKIKNLEDDLLE HNLEKLTKALK----YMEDYSLRNIVVEKELKYYKNLISKIENEIETLVEN----IKKD 686 NEEKKNIKTEGQSDNSEPSTEGEITGQATTKPGQQAGSALĖGDSVQAQAQEQKQAQPPVP -DIVNDCEEKLKQAK----746 VPVPEAKAQVPTPPAPVNN--KTENVSKLDYLEKLYEFLNŢSYICHKYILVSHSTMNEKI · · · · · · NDLMKDME 488 YEKLLNEIYD-----SKFNNNIDLINFEKMMGKRYSYKVEKLTHHNTFASYENS----K EEQLFEKKITKDENKPDEKILEVSDIV----KVQVQKVLLMNKI-----DELKKTQLILKNV---ELKHNIHVPNSYKQENKQEPYYLIVLKKEIDKLKVFMPKVESLI LKQYKITK - - EEESKLSSCDPLDLLFNIQNNIPVMYSMFDSLNNSLSQLFMEIYEKEMVC Indels 354; Query Match 5.1%; Score 431; DB 21; Length 980; Best Local Similarity 23.1%; Pred. The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity Y-KMQIKKLTLLKEQLESKLNSL----NNPKHVLQNFSVFFNKKKEAE-IAETENTLEN 1080 979 NSLNDESKRK-----KLEEDINKLKKTLQLSFDLY--NKYKLKLERLFDKKKTVGK 1027 ------KKKNEEE----KERNEET New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess LINNSLKLFENILSLGKNKNIYQELIGQKSSENFYEKILKDSDTFYNESFTNFVKSKADDI 814 EHQKEDRKRKDKKKKGHSSDKEEKYNKKEKTKEKSSNILFDEEYIIQLEELRDTGENCFI Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence represents a plasmodium vivax merozoite surface protein (MSP) C-terminal region. The C-terminal region of the merozoite surface protein has a strong antigenicity in malarial diseases. For diagnosis of malaria, recombinant proteins with hanced antigenicity, obtained by addition of fusion proteins to surface protein C-terminal regions, can be reacted with serum or blood of a Plasmodium infected patient. Antigen-antibody composites will be formed, and these are detected by Enzyme Linked Immunosorbent Assay (ELISA). The recombinant antigens provide a quick and reliable diagnosis of malaria, with good sensitivity
                                                                                                                                                                                                                                                                                                                                                                                                                                      New gene encoding merozoite surface protein of Plasmodium vivax, useful for producing protein for diagnosis of malaria and for vaccination -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1425 YKTVNDKIDLFVIHLEAKVLNYTYEKSNVEVKIKELNYLKTIQDKLADFKKNNNFVGIAD 1484

NAME OF THE PROPERTY OF THE PR

Shaw A;

```
The process of the human malarial parasite, plasmodium falciparum. Also described are: (1) nuclectide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against to the development of vaccines against antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, and the identification of drugs to treat or prevent P. falciparum infection, or they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasite biology, a process hampered by the vecine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many drugs. Ana/10078 to Ana/10287 and Analasis2 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification.
                                                                                                                                                                                                                                                                                                   The present invention describes proteins and their fragments (I) encoded
                                                                                                                        Proteins encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum, useful as antimalarial vaccines and in the diagnosis of P.falciparum infection
               Venter JC;
                                                                                                                                                                                                                                          Disclosure; Page 177-182; 577pp; English.

Talciparum infecti	o bisciosure; rade 120-124; 3//pp; English.	ine present invention describes proteins and their insymments (1) encoused. by chromosome 2 of the human malarial trassite, Plasmodium falciparum. also described are: (1) and active sequences (11) and (2).	vaccines against P. falciparum infection comprising (1) and (1). (1) and (1) are useful for the development of vaccines against	P. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to imminogens comprising the seminance of (I) are	useful in the detection of infection with P. falciparum. Furthermore, (1) (especially when they are rifins or secreted or membrane proteins)	can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in	P. falciparum Sequencing of the Plasmodium right consone 2 and the subsequent identification of proteins encoded by it will help to expand	our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for	vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurrence of malaria in many	parts of the world, and there is drugs. AAA70078 to AAA70287 and	and protein sequences given in specifically mentioned within the	Sequence	Query Match 4.9%; Score 411.5; DB 21; Length 1516; Best Local Similarity 21.3%; Pred. No. 6.5e-10;

the present invertice usersities proteins and utelf iragments (1) encoded according to the human malarial parasite, Plasmodium falciparum.

Also described are: (1) nucleotide sequences (II) encoding (I); and (2) accines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against C. (I) and (II) are useful for the development of vaccines against constitution in the detection of Infection with P. falciparum Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum (I) especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum (I) especially when they are rifins or secreted or membrane proteins) confection, or they can be used to identify drug resistance in the complexity of the plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand contraction of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for complexity of the parasitic resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many carefines of the world, and there is a pressing need for vaccines and enew carefines of the world, and there is a pressing need for vaccines and mosquito drugs. AAA70078 to AAA70287 and ABAB1814 to AABA1835 represent nucleotide sections and protein sequences given in the present invention, but which are not specifically mentioned within the specification. 105; present invention describes proteins and their fragments (I) encoded NVGKMEDYIKKNKKT-IENINE----LIEESKKTIDKNKNATKEEEKKKLYQAQYDLSIY 288 NV-----FISSYKKTNIININENSIYLIDSSDKENDRPMSSKRKRESK------ 232 293 TNMKRKNILLPHTGNKSESIRVIYASCLSSNKIYLRNINMCYDVVVFIKILRDLHF--PI 350 129 KHRVRNYLL--TIKELKYPQLFDLTNHMLTLCDNIHGFKYLIDGYEEINELLYKLNFYFD 186 ELEYYLREKNKNIDISAKVETKESTEPNEYPNGVTYPLSYNDINNALNELNSFGDL--IN 431 |: :| || :: | || 351 MLKG--RKIDKYIDNIINIQKKVYSEEMEKIDDEKRFTSVESINNSFN-INNMENIFRIQ 407 PFDYTK-----EPSKNIYTDNERKKFINEIKEKIKIEKKKIESDKKSYEDRSKSLNDITK 486 ----MM 513 Gaps 131 INETYLSLHIKDVIHNLYVSNYIVYLNYLVLFNPVHISKIKKNIL-IQIPMDIILKVLCP L----LRAKLNDVCANDYCQ---IPFNLKIRANELDV--LKKLVFGYRKPLDNIK----D -----PANSGNTPNTL-----LDKNKKIEEHEKEIKEIAKTIKFNIDSLFTDPL parasite, and in the 4.8%; Score 408.5; DB 21; Length 2539; ilarity 19.1%; Pred. 94; falciparum and Candida albicans are used to detect infections of these 265 DFFSEDRKEKSSSVGYDXKKKNXSNIKRFHNKINRTKEEKKKK-------WNKIIIN 362 AHNLIS-----VLEKRI--DTLKKNENIKELLDKINEIKNPPPANSGNTPNTLLD 342 472 KTKILKY----VYNYFKEFINNVIN--TKFGKIYRKF------FPRKHILNKI 512 KEKIKIEKKKIESDKKSYEDRSKSLNDITKEYEKLLNEIYDSKFNNNIDLTNFEKMMGKR 516 SDNSSDS--DAKSYADLKHRVRNYLLTIKELKYPQLFDLTNHMLTLCDNIHG-FKYLIDG 170 253 294 414 343 KNKKIEEHEKEI-KEI-AKTIKFNIDSLFTDPLELEYY----LREKNKNIDISAKVETKE 396 415 HNNFIDEYKQKICKQIKCSTKKNDISHIITSRKENHLFHVQKLENNYKHPNINKQL---R 471 STEPNEYPNGVTYPLSYNDINNALNELNSFGDLINPFDYTKEPSKNIYTDNERKKFINEI 456 Gaps The invention relates to identification and use of telomerase reverse transcriptuse (TERT) genes and proteins isolated from Plasmodium falciparum. Candida albicans and rice. TERT gene is also called as ever shorter telomere (EST) gene. TERT gene is are used to detect P. falciparum and C. albicans infection in mammals. They are also used to diagnose the state of an infection in a patient and the relative amount of the pathogen in a cell, tissue, organ or organism. The potential binding partners and modulators of the activity of TERT genes and proteins are used to inhibit or promote growth of the pathogens and hence are used to treat e.g. stomach cancer, malaria and vaginal candidiasis in LVFGYRKPLDNI -----KDNVGKMEDYIKKNKKT -- IENINELIEESKKTIDK --------N--NATKEEEKKKLYQAQYDLSIYNKQLEE YEEINELLYKLNFYFDLLR------AKLNDVCANDYCQIPFNLKIRANELDVLKK Length 2184; The present sequence is Plasmodium falciparum TERT full length Indels Score 402.5; DB.22; Pred.                                                                                                                                                                                                                                                                                                           The present sequence represents CENP-E (centromere-associated protein-E) of Xenopus. The protein has at least one of plus end-directed microtubule motor activity, ATPase (adenosine triphosphatase) activity and microtubule binding activity. CENP-E is the motor that powers chromosome movement toward microtubule plus ends and is essential for congression of chromosomes during mitosis. Modulators of CENP-E can thus control cell proliferation. Agents that modulators of CENP-E can thus control therapeutic, bioagricultural and diagnostic agents, e.g. for treatment of unwanted cell proliferation (typical of many examples are tumors and metastases; vascular malfunction; inflammatory and immune diseases; angiogenesis; hypertension; restenosis; and fungal infections), also as plant-protection agents (selective herbicides, fungicides and insecticides) and plant growth regulators or activators for improving yields. CENP-E is also a diagnostic marker for dividing cells, including

```
The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. C Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

C vaccines against P. falciparum infection comprising (I) or (II).

CC (I) and (II) are useful for the development of vaccines against comprising the sequences of (I); are useful in frection. (I) and polyclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, and the identification of fargs to treat or prevent P. falciparum complexity of the plasmodium chromosome 2 and the infection, or they can be used to identify are resistance in cour understanding of parasite biology, a process hampered by the complexity of the parasite biology, a process hampered by the complexity of the parasite biology, a process hampered by the complexity of the parasite infection, and provide new targets for resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new cross the world, and there is a pressing need for vaccines and new can protein sequences given in the present invention, but which are not specifically mentioned within the specification.
                                                                                                       2296 AHKHCMINIKESLSSTLSRSFGSLQTEHVKLNTQLQTLLNKFKVVYRTAAVKEDHSLIKD 2355
